CSC380: Principles of Data Science

Clustering

Xinchen Yu

- Fill out SCS (https://scsonline.oia.arizona.edu/) – if 80% responses, will add 5 points to the homework with lowest grade (33% right now).

- The final project due date is Friday, Dec 8.

- No lecture next Thursday, Dec 7

Announcements

- Final exam
  - Time: Dec 13, 3:30 - 5:30pm
  - Location: C E Chavez Bldg, Rm 111 (same room)
  - What you can bring:
    - one letter size cheat sheet, you can use double sides
   - calculator (not necessary)

Announcements

- ~20 questions and 50% questions will be before midterm.
- Office hours next week will be announced this Thursday.
- Practice questions will be out by next Monday Dec 4.
- No coding questions.
- How to prepare
  - **Slides**
  - Practice problems (helpful but do not only rely on it!)
  - HW questions
Supervised Learning · Unsupervised Learning

Task 1 : Group These Set of Document into 3 Groups based on meaning

Doc1 : Health , Medicine, Doctor

Doc 2 : Machine Learning, Computer

Doc 3 : Environment, Planet

Doc 4 : Pollution, Climate Crisis

Doc 5 : Covid, Health , Doctor

- Provides a summary of a corpus.
- Collected n tweets containing the keyword "bullying", "bullied", etc.
- Extracts k topics: each topic is a list of words with importance weights.
  - A set of words that co-occurs frequently throughout.

"feelings"

"suicide"

"family"

"school"

"verbal bullying"

"physical bullying"

Learning from bullying traces in social media.
Jun-Ming Xu, Kwang-Sung Jun, Xiaojin Zhu, and Amy Bellmore.
In the Conference of North American Chapter of the Association for Computational Linguistics: Human Language Technologies (**NAACL HLT**), 2012. [pdf]

- Learning with unlabeled data
- What can we expect to learn?
  - **<u>Clustering</u>**: obtain partition of the data that are well-separated.
    - a preliminary <u>classification without predefined class labels</u>.
  - **<u>Components</u>**: extract common components
    - e.g., topic modeling given a set of articles: each article talks about a few topics => extract the topics that appear frequently.

- How can we use?
  - As a summary of the data
    - **<u>Exploratory data analysis</u>**: what are the **<u>patterns</u>** even without labels?
  - As a 'preprocessing techniques'
    - e.g., extract useful **<u>features</u>** using soft clustering assignments

- Input: k: the number of clusters (hyperparameter)
$$S = \{x_1, \ldots, x_n\}$$

- Output
  - partition $\{G_i\}_{i=1}^k$ s.t. $S = \cup_i G_i$ (disjoint union).
 - often, we also obtain 'centroids'
Centroid-based Clustering

Hierarchical Clustering

Distribution-based Clustering

(probabilistic treatment)

- Input: k: the number of clusters (hyperparameter)

$$S = \{x_1, \ldots, x_n\}$$

- Output
  - partition $\{G_i\}_{i=1}^k$ s.t. $S = \cup_i G_i$ (disjoint union).
  - often, we also obtain 'centroids'

- Q: if we are given the groups, what would be a reasonable definition of centroids?
  - The **point** that has the minimum average **distance** to the datapoints?
  - The **datapoint** that has the minimum average **distance** to the datapoints?
  - The **point** that has the minimum average **squared distance** to the datapoints?

=> Turns out, the last one corresponds to the average point!

**Lloyd's algorithm**: solve it approximately (heuristic)
Observation: The chicken-and-egg problem.

• If you knew the cluster assignments… just find the centroids as the average
• If you knew the centroids… make cluster assignments by the closest centroid.

Why not: start from some centroids and then alternate between the two?
Arbitrary/random initialization of c_1 and c_2
(A) update the cluster assignments.   (B) Update the centroids $\{c_j\}$

(A) update the cluster assignments.

(B) Update the centroids $\{c_j\}$

(A) update the cluster assignments.

(B) Update the centroids $\{c_j\}$
(A) update the cluster assignments.
(B) Update the centroids $\{c_j\}$

Iterating until Convergence

Input: k: num. of clusters, $S = \{x_1, \ldots, x_n\}$

[Initialize] Pick $c_1, \ldots, c_k$ as randomly selected points from S (see next slides for alternatives)

For t=1,2,…,max_iter

- ***[Assignments]*** $\forall x \in S, \quad a_t(x) = \arg\min_{j \in [k]} \left\| x - c_j \right\|_2^2$

- If $t \neq 1$ AND $a_t(x) = a_{t-1}(x), \forall x \in S$
  - break

$$\|x\|_2 = \sqrt{x_1^2 + x_2^2}$$

Input: k: num. of clusters, $S = \{x_1, \ldots, x_n\}$

[Initialize] Pick $c_1, \ldots, c_k$ as randomly selected points from S (see next slides for alternatives)

For t=1,2,…,max_iter

- **[Assignments]** $\forall x \in S, \quad a_t(x) = \arg\min_{j \in [k]} \|x - c_j\|_2^2$

- If t $\neq 1$ AND $a_t(x) = a_{t-1}(x), \forall x \in S$
  - break

- **[Centroids]** $\forall j \in [k], \quad c_j \leftarrow \text{average}(\{x \in S : a_t(x) = j\})$

Output: $c_1, \ldots, c_k$ and $\{a_t(x_i)\}_{i \in [n]}$

But,

It may converge to a local rather than global minimum.

number of clusters   number of cases
centroid for cluster j

case i

$$\text{objective function} \leftarrow J = \sum_{j=1}^{k} \sum_{i=1}^{n} \left\| x_i^{(j)} - c_j \right\|^2$$

Distance function

Local optima

Andrew Ng

- You usually get suboptimal solutions
- You usually get different solutions every time you run.

- **Standard practice**: Run it 50 times and take the one that achieves the smallest objective function
  - Recall: $\min\limits_{c_1,\dots,c_k} \sum_{i=1}^{n} \min\limits_{j\in[k]} \left\| x_i - c_j \right\|_2^2$ Each run of algorithm outputs $c_1, \dots, c_k$. Compute this to evaluate the quality!

- And/or, change the initialization (next slide)
  - Idea: ensure that we pick a widespread $c_1, \dots, c_k$

- **k-means++**
  - Pick $c_1 \in \{x_1, \ldots, x_n\}$ uniformly at random
  - For $j = 2, \ldots, k$
    - Define a distribution $\forall i \in [n], \ \mathbb{P}(c_j = x_i) \propto \min_{j'=1,\ldots,j-1} \|x_i - c_{j'}\|_2^2$
    - Draw c_j from the distribution above.

      More likely to choose x_i that is farthest from already-chosen centroids.
=> has a mathematical guarantee that it will be better than an arbitrary starting point!

Suppose we have the small dataset
$[(7,4),(8,3),(5,9),(3,3),(1,3),(10,1)]$ to which we wish to assign 3 clusters.

We begin by randomly selecting $(7,4)$ to be a cluster center.

x	$\min(d(x,z_i)^2)$
$(7,4)$	
$(8,3)$	
$(5,9)$	
$(3,3)$	
$(1,3)$	
$(10,1)$	

Suppose we have the small dataset
[(7,4),(8,3),(5,9),(3,3),(1,3),(10,1)] to which we wish to assign 3
clusters.
We begin by randomly selecting (7,4) to be a cluster center.

| x	$\min(d(x,z_i)^2)$
(7,4)	-
(8,3)	2
(5,9)	29
(3,3)	17
(1,3)	37
(10,1)	18

Suppose we have the small dataset
